

Important Facts About Controlled Substance Prescription Medications

Know the Risks

There are many types of controlled substance prescription medications that are used to treat a variety of conditions including: moderate to severe pain, cough, attention disorders, anxiety, seizures, sleeping disorders, obesity, and many others. Controlled substances can be effective aids in the management and treatment of these conditions, when taken as directed by your health care practitioner. Controlled substance medications can also lead to serious risks and potential complications, which may include heart attack or stroke, hormonal imbalances that also may affect certain organs, abnormal thoughts and behavior, memory loss or disturbances, anxiety, worsening of depression, suicidal thoughts, difficulty breathing, significant drowsiness, stupor, coma, and death. Possible side effects will vary depending on the type of medication you are taking. Even when used as directed, additional risks are possible including physical dependence, tolerance, misuse and abuse, addiction, relapse of addiction symptoms, overdose, and death.

Know the Facts

- Combining controlled substances with alcohol or certain other medications, such as benzodiazepines (some examples are alprazolam, diazepam, and clonazepam), increases the risk of experiencing serious or life-threatening side effects.
- Other prescriptions or over-the-counter medications may significantly increase the risk of side effects, including overdose. Always read the warning labels on any prescription or over-the-counter medications before taking, and take only as directed.
- Discontinuing certain medications, such as an opioid or benzodiazepine, may lead to withdrawal symptoms, which may include: leg or abdominal cramps, muscular pain and tremors, piloerection (goosebumps), nausea, vomiting, appetite changes, heart palpitations, panic attacks, mood swings, diarrhea, dilated pupils, thinking and memory difficulties, and sleep disturbances. Symptoms will vary depending on the controlled substance medication you are taking.
- Do not increase your dose or take more frequent doses than prescribed by your practitioner.
- If your pain is relieved to your satisfaction, you may decide to stop taking the medication. If you have leftover medication, you should follow appropriate disposal guidelines.
- If you prefer to avoid opioids altogether, your doctor can talk to you about other, alternative means of treating your pain without opioids.
- Seek medical attention immediately if experiencing unusual symptoms, which may include: pain, swelling, redness or tingling in arms or legs, severe headache, confusion, chest pain, severe pelvic pain, dizziness or lightheadedness, suicidal thoughts, extreme sleepiness, slowed or difficult breathing, or unresponsiveness. Be particularly cautious when beginning treatment with a controlled substance prescription medication, when your health care practitioner changes your dose, or if you consume extra dosages.
- As a safety measure, while you are taking opioid medications, you may want your family and friends to be trained to administer naloxone to reverse an overdose. For more information on naloxone and training available in your area, go to www.oasas.ny.gov/atc/ATCherointraining.cfm.
- Medication is intended only for the person for whom it was prescribed. Never share medications.
- Store all medications in one designated location, in a dry and cool place. Be sure the medication location is safe and secure. Routine tracking of medications is a good idea, especially when others live with, or are visiting, you. A Medicine Cabinet Inventory Sheet can be downloaded at: www.health.ny.gov/publications/1090.pdf.
- For more information concerning the possible risks and side effects of this prescription, or other medications you are taking, talk to your prescriber or pharmacist.

Warning Signs of Addiction

Physical Signs:

- Loss or increase in appetite; unexplained weight loss or gain
- Inability to sleep, unusual laziness, or agitation
- Smell of substances on breath or clothes
- Nausea, vomiting, sweating, shakes of hands, feet or head
